Concrete5

DataBase

```
sudo mysql -u root -p
```

```
CREATE DATABASE concrete_db;
```

```
CREATE USER 'concrete_user'@'localhost' IDENTIFIED BY 'ChangeME';
```

```
GRANT ALL PRIVILEGES ON concrete_db.* TO 'concrete_user'@'localhost';
```

```
FLUSH PRIVILEGES;
```

Install PHP-mods

```
sudo apt install -y php8.2-curl php8.2-xml php8.2-gd php8.2-mbstring php8.2-mysql php8.2-cli  
php8.2-zip
```

Install CMS

The New Way:

<https://github.com/concretecms/composer/blob/master/README.md>

<https://github.com/concretecms/concretecms>

The Old way:

Get Downlod Link: <https://www.concretecms.org/download>

```
cd /var/www
```

```
sudo wget https://www.concretecms.org/download_file/9cbfcc11-37cc-433e-b18d-e57adb5c1c9f/2658  
-0 concrete.zip  
sudo unzip concrete.zip
```

```
sudo rm -rfv concrete.zip
```

```
sudo vim /etc/apache2/sites-available/000-default.conf
```

```
<VirtualHost *:80>
```

```
□# The ServerName directive sets the request scheme, hostname and port that  
□# the server uses to identify itself. This is used when creating  
□# redirection URLs. In the context of virtual hosts, the ServerName  
□# specifies what hostname must appear in the request's Host: header to  
□# match this virtual host. For the default virtual host (this file) this  
□# value is not decisive as it is used as a last resort host regardless.  
□# However, you must set it for any further virtual host explicitly.
```

```
□#ServerName www.example.com
```

```
□ServerAdmin webmaster@localhost
```

```
□DocumentRoot /var/www/concrete-cms-9.2.1/
```

```
□<Directory /var/www/concrete-cms-9.2.1/>
```

```
□□Options Indexes FollowSymLinks MultiViews
```

```
□□AllowOverride All
```

```
□□Order allow,deny
```

```
□□allow from all
```

```
□</Directory>
```

```
□# Available loglevels: trace8, ..., trace1, debug, info, notice, warn,
```

```
□# error, crit, alert, emerg.
```

```
□# It is also possible to configure the loglevel for particular
```

```
□# modules, e.g.
```

```
□#LogLevel info ssl:warn
```

```
□ErrorLog ${APACHE_LOG_DIR}/error.log
```

```
□CustomLog ${APACHE_LOG_DIR}/access.log combined
```

```
□# For most configuration files from conf-available/, which are
```

```
□# enabled or disabled at a global level, it is possible to
```

```
□# include a line for only one particular virtual host. For example the
```

```
□# following line enables the CGI configuration for this host only
```

```
□# after it has been globally disabled with "a2disconf".
```

```
□#Include conf-available/serve-cgi-bin.conf
```

```
</VirtualHost>
```

```
sudo chown -R www-data:www-data /var/www/
```

```
sudo systemctl restart apache2.service
```

Backup

/opt/scripts/backup.sh

```
#!/bin/bash

# Setzen Sie die Variablen
BACKUP_DIR="/backup"
WEB_DIR="/var/www/concrete-cms-9.2.1"
DB_NAME="concrete_db"
DB_USER="concrete_user"
DB_PASS="ChangeME"

# Generieren Sie den Dateinamen mit Datum und Uhrzeit
echo "Generate data name...."
DATE=$(date +%Y%m%d_%H%M%S)
FILE_NAME="backup_${DATE}.tar.gz"
DB_DUMP_NAME="db_dump_${DATE}.sql"

# Erstellen Sie die Unterordner, falls sie nicht existieren
echo "checking folders...."
mkdir -p $BACKUP_DIR/web
mkdir -p $BACKUP_DIR/DB

# Erstellen Sie das tar.gz-Archiv
echo "compressing...."
tar -czf $BACKUP_DIR/web/$FILE_NAME $WEB_DIR

# Erstellen Sie den Datenbank-Dump
echo "dumping...."
mysqldump -u $DB_USER -p$DB_PASS $DB_NAME > $BACKUP_DIR/DB/$DB_DUMP_NAME

# Funktion zum Löschen der ältesten Backups, wenn mehr als 30 vorhanden sind
cleanup() {
    echo "Checking if cleanup is necessary..."
    while [ $(ls -lqA $BACKUP_DIR/web | wc -l) -gt 30 ]
```

```

do
    OLDEST_BACKUP=$(ls -tr $BACKUP_DIR/web | head -1)
    echo "Deleting oldest backup: $OLDEST_BACKUP"
    rm -f $BACKUP_DIR/web/$OLDEST_BACKUP
done
while [ $(ls -lqA $BACKUP_DIR/DB | wc -l) -gt 30 ]
do
    OLDEST_BACKUP=$(ls -tr $BACKUP_DIR/DB | head -1)
    echo "Deleting oldest backup: $OLDEST_BACKUP"
    rm -f $BACKUP_DIR/DB/$OLDEST_BACKUP
done
}

# Führen Sie die Bereinigungsfunktion aus
cleanup

echo "Backup erfolgreich erstellt in $BACKUP_DIR/web/$FILE_NAME und
$BACKUP_DIR/DB/$DB_DUMP_NAME"

```

Crontab

```

# Edit this file to introduce tasks to be run by cron.
#
# Each task to run has to be defined through a single line
# indicating with different fields when the task will be run
# and what command to run for the task
#
# To define the time you can provide concrete values for
# minute (m), hour (h), day of month (dom), month (mon),
# and day of week (dow) or use '*' in these fields (for 'any').
#
# Notice that tasks will be started based on the cron's system
# daemon's notion of time and timezones.
#
# Output of the crontab jobs (including errors) is sent through
# email to the user the crontab file belongs to (unless redirected).
#
# For example, you can run a backup of all your user accounts

```

```
# at 5 a.m every week with:
# 0 5 * * 1 tar -zcf /var/backups/home.tgz /home/
#
# For more information see the manual pages of crontab(5) and cron(8)
#
# m h dom mon dow  command

0 2 * * * /opt/scripts/backup.sh
```

Docker and Docker-compose

```
# Add Docker's official GPG key:
sudo apt update; \
sudo apt install -y ca-certificates curl gnupg; \
sudo install -m 0755 -d /etc/apt/keyrings; \
curl -fsSL https://download.docker.com/linux/debian/gpg | sudo gpg --dearmor -o
/etc/apt/keyrings/docker.gpg; \
sudo chmod a+r /etc/apt/keyrings/docker.gpg; \

# Add the repository to Apt sources:
echo \
  "deb [arch="$(dpkg --print-architecture)" signed-by=/etc/apt/keyrings/docker.gpg]
https://download.docker.com/linux/debian \
  "$(. /etc/os-release && echo "$VERSION_CODENAME")" stable" | \
  sudo tee /etc/apt/sources.list.d/docker.list > /dev/null
sudo apt update
```

```
sudo apt install -y docker-ce docker-ce-cli containerd.io docker-buildx-plugin docker-compose-
plugin
```

If Failure like this:

```
failed to register layer: lsetxattr user.overlay.impure /etc: operation not supported
```

Do on vhost:

```
vim /etc/pve/lxc/xxx.conf
```

and add:

```
unprivileged: 0 # only change value
lxc.apparmor.profile: unconfined
```

lxc.cap.drop:

lxc.cgroup.devices.allow: a

npm / nodejs
